Dropbox Accidentally Unlocked All Accounts For 4 Hours

ADAM DACHIS 21 JUNE, 2011 11:05 AM

Share Discuss Bookmark

Oops! Dropbox accidentally dropped the need for password authentication this past Sunday so anyone could log into anybody else's Dropbox account with nothing but an email address.

This lasted four hours and, apparently, less than 1 per cent of users were affected, but this is just another reason why you should [add an extra layer of security to the data in your Dropbox](#).

[Dropbox Left User Accounts Unlocked for 4 Hours Sunday \[Wired\]](#)

Project Overview

- Web Server for ownCloud and Subsonic apps
 - Web interface to upload, browse, and download
 - WebDAV interface
 - API for syncing
 - Web interface to your media files
 - Streaming

Project Overview

Prerequisites and Materials

- Intermediate Linux skills
 - Command line skills
 - <http://ubuntuguide.org/>
<http://ubuntu-manual.org/>
- Spare computer or hosted server
 - 384MiB of RAM
 - Enough storage space for your file collection
- Lubuntu Linux
- Network connection
- Time

Server Config: Static IP Address

```
$ nm-tool
NetworkManager Tool
State: connected (global)
- Device: eth1 [nat]
-----
Type:                Wired
Driver:              e1000
State:               connected
Default:             yes
HW Address:          08:00:27:4C:DB:F3
Capabilities:
  Carrier Detect:    yes
  Speed:             1000 Mb/s
Wired Properties
  Carrier:           on
IPv4 Settings:
  Address:           192.168.1.103
  Prefix:           24 (255.255.255.0)
  Gateway:          192.168.1.1
  DNS:              192.168.1.1
```

Server Config: Static IP Address

Editing host

Connection name: host

Connect automatically

Wired | 802.1x Security | IPv4 Settings | IPv6 Settings

Method: Manual

Addresses

Address	Netmask	Gateway
192.168.56.52	255.255.255.0	0.0.0.0

DNS servers:

Search domains:

DHCP client ID:

Require IPv4 addressing for this connection to complete

Routes...

Available to all users

Cancel Save...

Server Config: Hostname

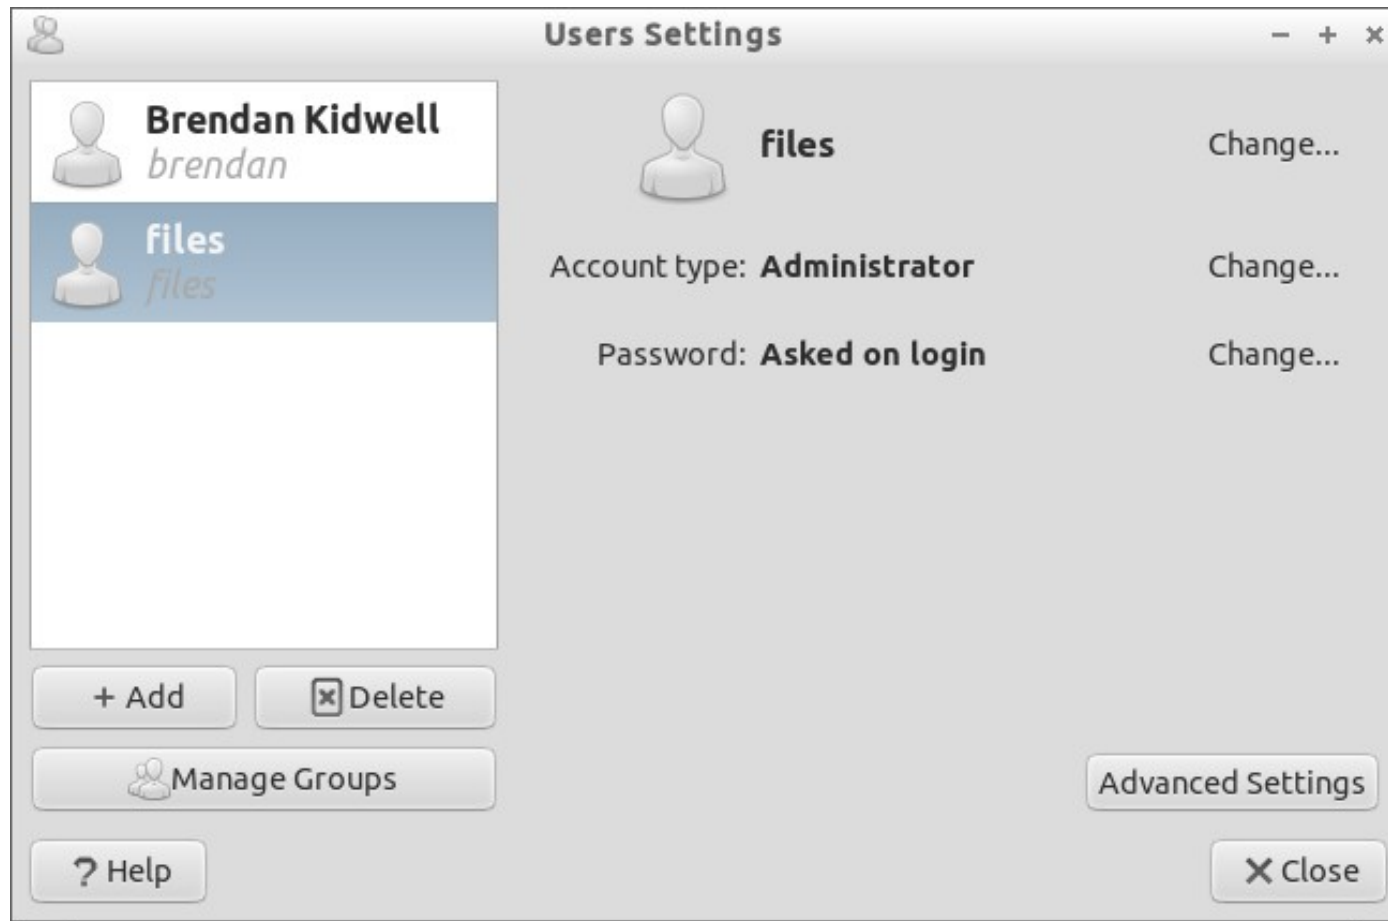

“/etc/hosts” on client machines:

Add

192.168.1.50 files

to end of file.

Server Config: 'files' User Account

Server Config: SSH Server

```
$ sudo apt-get install openssh-server
```

Install Software Stacks

```
$ sudo apt-get install curl libcurl3 mysql-server nginx openjdk-6-jre \  
php-apc php-xml-parser php5-cgi php5-curl php5gd php5-intl php5-mysql \  
php5-mysql php5-sqlite smbclient
```

Install Software Stacks: PHP

```
$ sudo nano /etc/init/php-fastcgi-files.conf
```

```
-----  
# /etc/init/php-fastcgi-files.conf  
# php-fastcgi-files - starts php-cgi as an external FASTCGI process  
description "php-fastcgi-files - keep up php-fastcgi"  
start on runlevel [2345]  
stop on runlevel [!2345]  
respawn  
exec /usr/bin/sudo -u files PHP_FCGI_CHILDREN=5 PHP_FCGI_MAX_REQUESTS=125  
↳ /usr/bin/php-cgi -q -b /tmp/php-fastcgi-files.socket  
-----
```

```
$ sudo service php-fastcgi-files start  
php-fastcgi-files start/running, process 10098
```

Install Software Stacks: Nginx

```
$ sudo nano /etc/nginx/sites-available/default
```

Add at top of file:

```
-----  
upstream phpfiles {  
    server unix:/tmp/php-fastcgi-files.socket;  
}  
-----
```

Add at the end of "server" block:

```
-----  
    include apps/*.conf;  
-----
```

Install Software Stacks: phpMyAdmin

```
$ sudo mkdir /etc/nginx/apps  
$ sudo nano /etc/nginx/apps/phpmyadmin.conf
```

```
-----  
rewrite ^/phpmyadmin$ /phpmyadmin/ permanent;  
location /phpmyadmin/ {  
    alias /home/files/Apps/phpmyadmin/;  
    index index.php;  
}  
location ~ ^/phpmyadmin/(.*\.php)$ {  
    root /home/files/Apps;  
    fastcgi_intercept_errors on;  
    fastcgi_param SCRIPT_FILENAME  
$document_root$fastcgi_script_name;  
    fastcgi_pass phpfiles;  
    include fastcgi_params;  
}  
-----
```

```
$ sudo service nginx restart  
Restarting nginx: nginx.
```

Installing ownCloud

```
$ sudo nano /etc/php5/cgi/php.ini
```

```
... Change post_max_size and upload_max_size to 2000M
```

```
$ sudo service php-fastcgi-files restart  
php-fastcgi-files stop/waiting  
php-fastcgi-files start/running, process 13128
```

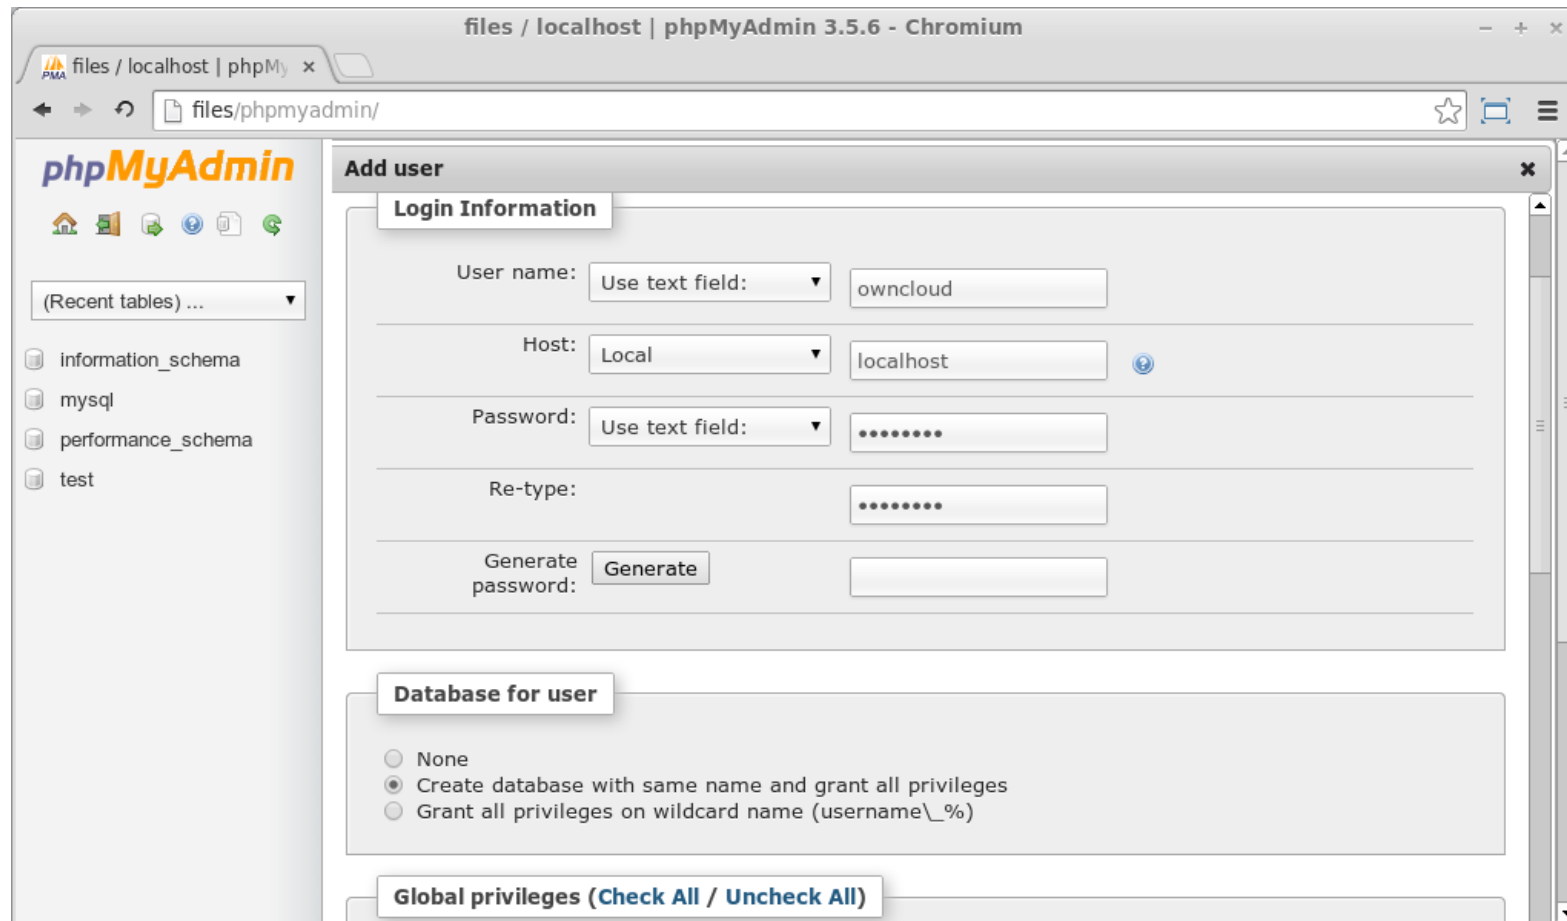

Installing ownCloud

```
$ sudo nano /etc/nginx/apps/owncloud.conf
```

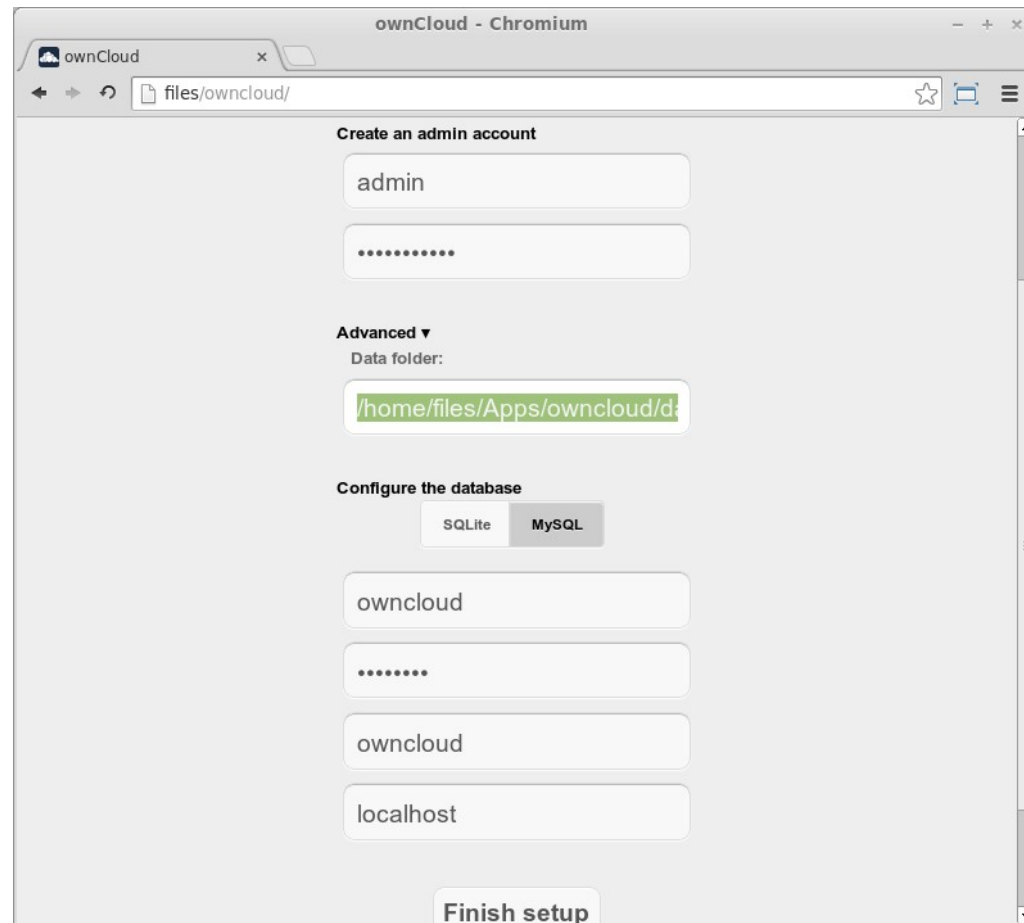

```
-----  
client_max_body_size 2000M;  
rewrite ^/owncloud$ /owncloud/ permanent;  
location /owncloud/ {  
    alias /home/files/Apps/owncloud/;  
    index index.php;  
    try_files $uri $uri/ @owncloudwebdav;  
}  
location @owncloudwebdav {  
    root /home/files/Apps;  
    fastcgi_split_path_info ^(.+\.(php|php5|php7|php8|php9|phpN|php[2-9])$|\.php$);  
    fastcgi_pass phpfiles;  
    fastcgi_param SCRIPT_FILENAME $document_root$fastcgi_script_name;  
    include fastcgi_params;  
}  
location ~ ^/owncloud/(.*\.(php|php5|php7|php8|php9|phpN|php[2-9]))$ {  
    root /home/files/Apps;  
    fastcgi_intercept_errors on;  
    fastcgi_param SCRIPT_FILENAME $document_root$fastcgi_script_name;  
    fastcgi_pass phpfiles;  
    include fastcgi_params;  
}  
location ~ ^/owncloud/(data|config|\.ht|db_structure\.xml|README) {  
    deny all;  
}  
-----
```

```
$ sudo service nginx restart  
Restarting nginx: nginx.
```

Installing ownCloud

Installing ownCloud

The screenshot shows the ownCloud installation web interface in a Chromium browser window. The browser's address bar displays "files/owncloud/". The page content is as follows:

- Create an admin account**
 - Username: admin
 - Password: masked with dots
- Advanced** (expanded)
 - Data folder: /home/files/Apps/owncloud/d
- Configure the database**
 - Database type: SQLite (selected), MySQL
 - Database name: owncloud
 - Password: masked with dots
 - Database user: owncloud
 - Database host: localhost
- Finish setup** button

Installing Subsonic

```
$ sudo dpkg -i subsonic-4.7.deb
```

```
. . .  
$ sudo nano /etc/default/subsonic
```

```
-----  
SUBSONIC_USER=files  
-----
```

```
$ sudo mkdir -p /var/subsonic  
$ sudo chown -R files:files /var/subsonic  
$ sudo nano /usr/share/subsonic/subsonic.sh
```

Change "SUBSONIC_CONTEXT_PATH" to the value "/subsonic".

```
$ sudo service subsonic restart  
* Restarting Subsonic Daemon subsonic  
Started Subsonic [PID 14178, /var/subsonic/subsonic_sh.log]  
...done.
```

Installing Subsonic

```
$ sudo nano /etc/nginx/apps/subsonic.conf  
  
-----  
rewrite ^/subsonic$ /subsonic/ permanent;  
location /subsonic/ {  
    proxy_pass http://localhost:4040;  
    proxy_set_header X-Real-IP $remote_addr;  
    proxy_set_header X-Forwarded-For $proxy_add_x_forwarded_for;  
    proxy_set_header Host $http_host;  
}  
-----  
  
$ sudo service nginx restart  
Restarting nginx: nginx.
```

Using ownCloud and Subsonic

(Demo)

Advanced Configuration

- Access from Outside your Local Network
 - Setup port forwarding on your home router
 - If using DD-WRT firmware,
http://www.dd-wrt.com/wiki/index.php/Port_Forwarding
- Internet Hostname
 - <http://dyn.com>
DynDNS is \$20/year
- Encrypting Traffic with TLS
 - Get a free SSL certificate at <http://www.startssl.com/> .
